

Filling the front desk: a voice agent for a busy physio clinic

Praxis am Englischen Garten, Munich · Engagement closed Q4 2025

Industry	Physiotherapy & rehabilitation, single-location private practice
Service line	AI Voice Receptionist
Engagement length	5 weeks build, 14 months managed
Investment	€3,400 build + €160/month managed
Compliance	GDPR, healthcare data minimisation, EU-only processing

The Challenge

Praxis am Englischen Garten is a four-therapist private physiotherapy clinic in central Munich. The owner, Dr. Hannah Wirth, had recently raised her therapists' utilisation target from 70% to 82% — a deliberate decision to make the practice financially viable without raising session prices. The bottleneck was not demand; the bottleneck was scheduling. The single front-desk coordinator could not pick up the phone fast enough during the 11:00–13:00 window when most existing patients called to rebook, and the answering service used after hours had a 14% callback success rate.

An estimated 24 calls per week were going to voicemail and never converting into bookings. At an average session value of €78, that was roughly €7,800 per month of foregone revenue.

Our Approach

We built a German-language voice agent on top of the practice's existing Sipgate trunk, using Deepgram for speech recognition, ElevenLabs for voice output, and Claude Sonnet 4 as the reasoning core. The agent had a deliberately narrow tool surface — book, reschedule, cancel, answer FAQ, escalate — and no clinical reasoning capability whatsoever. Anything that smelled like a pain question, a medication question, or distress was handed to Dr. Wirth's mobile via warm transfer or, after hours, a callback request was logged with priority flags.

Calendar integration was the trickiest piece. The clinic uses Theorg, which exposes only a partial API. We solved this with a hybrid approach: real-time availability checks via Theorg's calendar export, and bookings written through a thin middleware that the front-desk coordinator validated each morning during the first month. After 30 days of zero conflicts, we removed the morning validation step.

Results

96%

calls answered within 2 rings

+8.4%

appointment fill rate vs.
baseline

0

clinical-advice incidents in 14
months

€5,900

estimated monthly revenue
recovered

The fill-rate lift was lower than the theoretical maximum — physically, the clinic could not absorb every recovered call because therapist hours were already near saturation. The real win was that the front-desk coordinator's role shifted from answering the phone to working with patients in person, which improved both staff satisfaction and the on-arrival experience. Dr. Wirth's NPS-equivalent patient survey rose from 62 to 78 in the six months after launch.

In the client's words

"What I appreciated most was the discipline. The Nexrai team kept saying no to things — no, the agent will not explain a treatment, no, it will not handle insurance disputes, no, it will not do outbound recall calls until we have 100 clean ones in production. That restraint is why I trust it with my patients."

Dr. Hannah Wirth, Owner — Praxis am Englischen Garten

Lessons Learned

- Partial-API systems (like Theorg) can be integrated through a validation buffer in the first month — do not let API limitations block the engagement.
- Healthcare voice agents earn trust through restraint, not through capability. The list of things our agent refuses to do is longer than the list of things it does.
- Saturation matters. Recovering calls only translates to revenue if there is capacity to serve them. We now ask about utilisation in discovery, not just call volume.
