

Personalised flows that don't read like AI: a DTC marketing rebuild

Lieblingsglow Skincare, Berlin · Engagement Q3 2025 to ongoing

Industry	Direct-to-consumer skincare, ~€3.1M ARR at engagement start
Service line	AI Marketing Automation
Engagement length	6-week build, 9 months retainer (ongoing)
Investment	€5,800 build + €420/month retainer
Stack	Klaviyo, Shopify, Twilio, Meta Ads, on top of existing tools

The Challenge

Lieblingsglow's founder, Mira Hoffmann, had built a strong brand voice — calm, specific, unfussy, deliberately anti-hype — but her marketing automation flows had been written in 2022 by an agency and read like every other DTC skincare brand on the internet. Open rates were healthy at 31%, but click-through and revenue per recipient lagged comparable brands. The post-purchase flow treated first-time buyers and four-time repeat buyers identically, which Mira described as “the thing that annoys me most about my own marketing.”

She had also recently launched a subscription option, and the conversion path from one-time to subscription was an afterthought — a single email, sent at a fixed delay, with a 10% discount that loyal customers felt was insulting and new customers found unconvincing.

Our Approach

We started with two days on-site, recording how Mira and her two-person marketing team actually wrote copy. The output was a voice guide — eight pages, with banned phrases, sentence-length guidance, and explicit examples of competitor copy that Lieblingsglow would never publish. This guide became the system prompt for every Claude-driven generation in the new flows.

We rebuilt three flows: abandoned cart (now branched by cart value and customer history), post-purchase (split into first-time, second-time, and loyal-buyer tracks), and the subscription nudge (now triggered by repeat-purchase pattern detection rather than fixed delay, with copy that respected the customer's history). Critically, every email goes through a content-safety layer that rejects false-scarcity language, fake countdown timers, and discount-stacking that would cheapen the brand.

We did not migrate Lieblingsglow off Klaviyo. The new logic sits between Klaviyo events and Klaviyo sends — the team's existing dashboards, deliverability reputation, and segmentation work all continued to function. This was a deliberate choice: SMBs do not have the bandwidth for a tool migration on top of a logic rebuild.

Results

+22%	9.4%	3.2x	12 hrs
email-attributed revenue, Q1 post-launch	abandoned-cart conversion (was 6.1%)	subscription conversion rate	marketing time saved per week

The result we are most proud of is one that does not show up in the dashboard: zero brand-voice complaints from customers in nine months. Lieblingsglow's audience is sensitive to anything that feels generic or AI-flavoured, and we shipped roughly 240,000 automated sends without a single “this doesn't sound like you” reply, which Mira's previous agency could not say.

In the client's words

“Half the value was technical and half was the voice guide work. We had been running for six years and had never written down our voice in a way another human could follow, never mind a model. The eight-page document Nexrai produced is now what we onboard new copywriters with.”

Mira Hoffmann, Founder — Lieblingsglow

Lessons Learned

- Brand voice is the constraint, not the model. A good voice guide matters more than the choice of LLM.
- Sit on top of existing tools. Migrations during automation rebuilds double the risk and triple the timeline.
- Behavioural triggers (delivery webhook, repeat-purchase pattern) outperform time-based delays in every test we have run.
- Content-safety filters are non-negotiable in DTC. False scarcity language has a short-term lift and a long-term reputational cost.
